The NDPE IRF is a reporting tool designed to help organizations in the palm oil supply chain to systematically understand and track progress in delivering commitments of No Deforestation, No Peat and No Exploitation across the whole production base covering the full volumes sourced 2. There are currently several initiatives underway within the palm oil supply chain to support the achievement of NDPE commitments. Examples of such activities are certification and supplier engagement programs, or landscape and smallholders' support initiatives. The IRF tool enables to systematically capture all these activities. By including information on initial engagement actions such as workshops and policy developments, as well longer-term on-the ground actions and initiatives, the tool can summarize any progress or gaps in the implementation of NDPE commitments. Having an industry accepted framework to report progress on these initiatives will enable all the players in the sector to collectively monitor progresses, identify gaps and drive improvement.
